ABSTRACT

Trichomoniiasis is the most common sexually transmitted parasitic disease which is commonly seen by gynecologists. This infection may lead to certain infections and complications multiple problems including a discharge, painful urination, genital irritation, discomfort after intercourse, premature rupture of membranes, preterm labor, low birth weight, and increased risk of HIV infection. Metronidazole is a trichomonicide metronidazole drug that may cause nausea, vomiting, bad taste, gastrointestinal disorders, rash, urticaria, angioedema, dizziness, peripheral neuropathy, and transient neutropenia. Regarding that trichomoniiasis is one of the most important health issues in women, the aim of this review article is to report the medicinal plants that are effective on this parasite. *Taxus baccata*, *lavandula intermedia*, *Achillea millefolium*, *Artemisia absinthium*, *Juglans regia*, *Eucalyptus camaldulensis* Dehn., *Stachys lavandulifolia*, *Artemisia aucheri*, *Zataria multiflora*, *Myrtus communis*, *Pelargonium roseum*, *Freula asafoetida*, *Allium sativum*, *Tanacetum parthenium*, *Mentha piperita*, and *Salvia officinalis* have been found to be used to control trichomoniiasis. The main compounds of these plants can be investigated for potential efficacy on trichomoniiasis in clinical trials.

KEY WORDS: *Trichomonas vaginalis*, Women, Herbal medicine, Traditional medicine, Iran.

1. INTRODUCTION

Vaginal infections are an important health problem in women in health care systems (Sobel, 1999). Trichomoniiasis is the most common sexually transmitted parasitic infection which is commonly seen by gynecologists (Sobel, 1999). Infection with this parasite is associated with widely known symptoms and complications (Yasuda, 2009; Schmid, 2001). *Trichomonas vaginalis* is a flagellated parasite that is the cause of trichomonal vaginitis in women. This parasite can cause vaginitis, dysuria, and dyspareunia in women and urethritis in men (Cunningham, 2005; Robert, 2008; Jonathan, 2007; Wolner-Hanssen, 1989). However, excessive urethral and vaginal discharge, dysuria, itching and severe irritation of the genital tract, and abdominal pain are the most important and most common symptoms of trichomoniiasis. Trichomoniiasis is asymptomatic in 10-50 of the patients (Patel, 2000). Human being is the only known source of this parasite (Johnston and Mabey, 2008). As well, figures indicate that each year, over 200 million people worldwide are infected with *T. vaginalis* (Petrin, 19998; Fiori, 1997). Metronidazole and tinidazole are two drugs of choice to treat trichomoniiasis; however, these two drugs have been reported to cause teratogenicity, teratogenic effects on fetus, and drug resistance (Schwebke, 2006). Besides that, metronidazole is associated with certain complications including nausea, vomiting, bad taste, gastrointestinal disorders, rash, urticaria, angioedema, dizziness, peripheral neuropathy, and transient neutropenia. Metronidazole use is controversial during pregnancy, and is forbidden in the first trimester (Lance, 2006; Gerald, 2002). Therefore, more novel therapies with fewer side effects are being sought out.

Obviously, the use of medicinal plants is the oldest approach adopted by human beings to treat diseases, and throughout development in all human civilizations, there has been a very close relation between human beings and plants (Asadi-Samani, 2013; 2015; Bahmani, 2012; 2014; 2015; Saki, 2014; Parsaei, 2016; Nasri, 2015; Ahmadipour, 2016; Jivad, 2016; Mohsenzadeh, 2016). However, most of plant species have remained to be investigated adequately and even identified (Delfan, 2014; 2015; Ghasemi Pirbalouti, 2013; Bahmani, 2015; Rouhi-Boroujeni, 2016; Jivad, 2016; Asadbeigi, 2014; Parsaei, 2016). In the recent years, the use of medicinal plants and plant-based drugs has been on rise, such that medicinal plants are currently being used to treat many diseases (Moradi, 2012; 2013; Samarghandian, 2016; Kooti, 2014; Asadi-Samani, 2016; Rabiei, 2013; Bahmani, 2012; 2014; Nasri, 2014; Forouzan, 2012; Karamati, 2014). Medicinal plants can be used to treat diseases because of fewer side effects, patients better acceptance due to the recommendations of traditional medicine, past generations experiences, low cost, and agreeability to the body's physiological function (Bahmani, 2013; 2014; 2015; 2016; Shirani, 2011; Saki, 2014; Gholami-Ahangaran, 2012; Eftekhari, 2012; Beyrami-Miavagi, 2014).

Since trichomoniiasis is one of the most important health problems in women and the drugs with fewer side effects and greater efficacy are being sought out, this study was conducted to report the medicinal plants that are effective on this parasite.
2. MATERIALS AND METHODS

In this review article, the key words consisting of *T. vaginalis*, medicinal plants, phytochemical compounds, extract, essential oil, and Iran were used to search for relevant articles in Google Scholar, Scientific Information Databases, and other databases. Only the articles that reported the works directly investigating the effects of medicinal plants and their derivatives on *T. vaginalis* were included.

DISCUSSION

According to the findings, Taxus baccata, lavandula intermedia, Achillea millefolium, Artemisia absinthium, Juglans regia, Eucalyptus camaldulensis Dehn, Stachys lavandulifolia, Artemisia aucheri, Zataria multiflora, Myrtus communis, Pelargonium roseum, Frenula assafoetida, Allium sativum, Tanacetum parthenium, Mentha piperita, and Salvia officinalis are the native medicinal plants of Iran effective on T. vaginalis. According to traditional medicine, L. officinalis is reported to have antiparasitic, antimicrobial, antiviral, and anti-inflammatory effects (Gamez, 1990; Buchbauer, 1991). Furthermore, the antifungal and antioxidant properties of A. millefolium have been confirmed in some scientific investigations (Magiatis, 2000; Ayatollahi Mousavi, 1996; Sokmen, 2004). In some traditional medicine textbooks, J. regia is reported to treat ringworm, fungal, bacterial, and viral infections, and inflammatory diseases. Phytochemical investigations have demonstrated that 5-hydroxy 1,4-naphthoquinone is an effective compound of J. regia (Alkhawajah, 1997), which may explain the anti-T. vaginalis effects of this plant. A. absinthium has some properties such as insecticidal, appetizing, and antiparasitic (Ramezani, 2005). E. camaldulensis has disinfectant, refrigerant, antispasmodic, hypoglycemic, and antiparasitic (Ministry of health and medical education, 2003). Antibacterial and antimicrobial effects of S. lavandulifolia have been confirmed. As well, S. lavandulifolia is used to treat gynecological infections (Morteza Semnani, 2010; Azadbakh, 2004; Rabbani, 2005). P. roseum contains geranium, citronellol, phenil alcohol malic acid, ethylic acid, and mannitol has been found to exert anti-inflammatory, analgesic, disinfectant, hemostatic, and anti-dysentery properties in experimental works (Edris, 2007). In different studies, various effects of Taxus baccata, including antitumor, antibacterial, antifungal, and anti-inflammatory, have been reported (Jennewein, 2001; Pars, 2009; Erdemoglu, 2001; Kupeli, 2003). Diterpenoid and triterpenoid compounds are the main compounds of Taxus baccata (Mossadegh, 1971). According to traditional medicine, A. sativum and F. assafoetida are used as antiparasitic agents (Azadbakh, 2002; Ghazanfari, 2000; Lemar, 2002). Allicin is the effective compound of A. sativum (Zargari, 1994). T. parthenium contains parthenolide, camphor, and alpha-pinene (Tassorelli, 2005). T. parthenium can exert antiparasitic properties (Mahdi, 2006; Luize, 2005). S. officinalis is a plant with disinfectant effects (Samsam Shariat, 2000; Royhan, 2001). M. piperita contains an effective compound called menthol with disinfectant properties (Ghasemi Pirbalouti, 2009).

4. CONCLUSION

Regarding the emphasis on the antiparasitic effects of these plants in the references of traditional medicine and phytotherapy, and the experimental works confirming the antiparasitic effects of these medicinal plants, we recommend to investigate potential anti-T. vaginalis effects of these plants in clinical trials to produce nature-based drugs effective on T. vaginalis.
